## Person 1 Work: Dataset and Chunking

Person 1 was responsible for preparing the dataset foundation for Deliverable 1. The main task was to convert the raw PDF research papers into a clean dataset that could be used by the retrieval, AutoML, and online learning parts of the project.

The work included collecting the research paper PDFs, extracting the text, cleaning unnecessary formatting noise, and splitting the extracted content into smaller chunks. Chunking was important because the retrieval system needs to search specific sections of papers instead of searching full documents at once.

Each chunk was assigned a unique chunk identifier and stored with useful metadata such as paper information, page number, and chunk text. This made the dataset organized and easy for the rest of the group to use.

The main output from Person 1 was:

- **chunks\_final.csv**

This file became the input for Person 2, who used it to build TF-IDF retrieval, dense retrieval, and hybrid retrieval.
